

Group 4 - Mining Simulator/Game

Current State:

- Pickaxe implemented with 2 grip points and collision detectors on head for mining.
- Mineral Deposit implemented with collision detector spawning ores when hit with pickaxe.
- The cave environment has been fully mapped out and ore is now spawned inside the environment.
- The user now spawns inside the cave and can play the full game.
- Headlamp is now able to be used as a hat with a head socket implemented on the XR rig.
- Small ore comes off mineral deposits and can be deposited via raycasting interaction into the mine cart
- A scoreboard is now available for the user to track progress with.

Core Interaction:

- Grab pickaxe with both controllers
- Swing pickaxe toward purple mineral deposit
- Each hit of the pickaxe will spawn a piece of ore
- Interact with the spawned ore to move it to the mine cart and gain score
- Move through the cave using teleportation to find new ores

Known Issues:

- The headlamp is missing its light source for now. It will be added once we polish our cave environment lighting.
- Teleportation pads have not been implemented yet and will be available in the final environment.
- The score element does not track progression perfectly and needs to be polished for the final product.
- Head tracking does not scale correctly with real life movements, users need to use the joysticks to look around.

Controls:

- Right joystick allows for boundaryless teleportation
- Hold grip on either joystick to pick up the pickaxe
- Move pickaxe toward mineral deposit while holding grip button.
- Use grip button to interact with ore and deposit it in the mine cart
